## **Claims**

1. Method for verifying digitized images of persons, in particular, for verifying the suitability of an image of a person for person identification, with the steps:

5

20

- segmenting the image of a person into a background area and a head or face area,
- analyzing the head or face area to determine at least one characteristic value,

  10

  comparing the at least one characteristic value with at least one predetermined threshold value.
- 2. Method according to claim 1, wherein the step of segmenting comprises performing a method for object recognition.
  - Method according to one of the preceding claims, wherein analyzing the head or face area comprises detecting at least one geometric feature of the head or face area.
  - 4. Method according to claim 3, wherein detecting at least one geometric feature of the head or face area comprises a size and/or shape and/or position and/or spatial orientation of the head or face area within the image of a person.
- Method according to one of the preceding claims, wherein analyzing the head or face area comprises detecting at least one reproduction feature of the head or face area.
- 6. Method according to claim 5, wherein the at least one reproduction feature that is to be detected comprises a contrast and/or a color distribution and/or a sharpness of the image and/or a brightness and/or a grade of staining and/or a measure for the irradiation of the head or face area.

face area comprises localizing sub-regions of the head or face area. 8. Method according to claim 7 with the additional step: 5 analyzing the at least one localized sub-region. Method according to one of the preceding claims with the step: 9. 10 analyzing the image of a person with respect to global criteria that apply to the entire image of a person. Method according to one of the preceding claims with the step: 10. 15 analyzing the background area of the image of a person. Method according to one of the preceding claims with the step: 11. determining whether a negatively evaluated image could fulfill the predetermined 20 quality criteria after image correction. 12. A correction method for digitized images of persons and, in particular, for an image of a person, which does not fulfill one or more quality criteria during a verification method according to one of the preceding claims, comprising 25 correcting at least one image reproduction feature in the entire image and/or the

Method according to one of the preceding claims, wherein analyzing the head or

7.

30

correcting at least one geometric feature of a head or face area displayed in the

head or face area and/or the background area, and/or

image of a person.

13. A data processing means for executing a method according to one of the claims 1 to 11. 14. A data processing means for executing a method according to claim 12. 15. A data processing means for executing a method according to one of the claims 1 to 11 and for executing a method according to claim 12. System for quality verification and correction of digitized images of persons com-·16. prising a storage means for storing digitized image data, a data processing means according to claim 13 and a data processing means according to claim 14, or a data processing means according to claim 15. 17. A system according to claim 16 comprising an apparatus for generating digitized image data. 18. A system according to claim 16 or 17 comprising

5

10

15

20

25

23

a display device for displaying whether a verified image or a modified image ob-

serves predetermined quality standards.
